Particularly Recommended Recent Books

Hawken, Paul. (Ed). 2017. *Drawdown*. Penguin. Outstanding, comprehensive climate change blockbuster. Detailed global analysis of 100 methods of all sorts that can help us avert climate catastrophe, ranked quantitatively in order of likely impact. Great, inspiring examples from across the globe. A don't-miss for anyone who cares in the slightest. Valuable website, too.

- Hawken's group's 2021 *Regeneration* is a worthy follow-up, but start with the original. Memorable *Regeneration* quote: "Since the Paris Agreement was signed in 2015, the banking industry has loaned and invested more than 3.8 trillion in the oil and gas industry, more than enough money to retrofit every building in America to be a zero-waste structure. The energy saved would exceed the amount gained by oil and gas exploration by a factor of ten."

DeMocker, Mary. 2018. *The Parents' Guide to Climate Revolution: 100 Ways to Build a Fossil-Free Future, Raise Empowered Kids, and Still Get a Good Night's Sleep*. New World. **Not just for parents.** Magnificent! Manages to be upbeat, innovative, and inspiring while fully accepting how little time we have left to confront the climate change challenge. No wonder Yale Climate Connections and many others love it (including everyone I've recommended it to). Whether you have kids or not, this fun-to-read book motivates and informs, with a wide range of wonderful suggestions. And we seem to have read many of the same climate change books. :-). If everyone acted on it, we have a real shot at avoiding catastrophe. This is the book we made available at our CA climate coalition events.

Thunberg, Greta (Ed). 2023. *The Climate Book*. Greta recruited well-known experts to cover every aspect of the climate crisis, resulting in about 100 short chapters of 2-4 pages each. It's simply packed with information. Should be on everyone's shelf.

Griffith, Saul. 2021. *Electrify: An Optimist's Playbook for Our Clean Energy Future*. US focus. Based on David Mackay's classic analysis of how to replace fossil fuels, all quantified. Lots of useful details and suggestions, lots of data; Griffith did a detailed breakdown of all US energy use for the Dept of Energy and it shows. Emphasizes the need to electrify everything quickly, and makes the case for rebates and other incentives. Starting the switch in 2000 would have let us reduce greenhouse gas emissions by 4% per year, for the 2030 goal. That's for holding warming to 1.5 C (2.7 F). Starting in 2020 gives 10 years, a needed reduction of 10% per year instead, much harder. Further waiting of even just a few years requires very fast, very large reductions, almost impossible. This is what's most frightening, how we've run out of time. But there **is** still time, if just barely, hence the optimism in the title. And the fact that the return on investment calculations greatly favor renewables. Also don't miss Appendix B, which suggests what citizens can do across categories like electricians, teachers, farmers, young people who can't vote yet, hourly workers, small business owners, tech workers, social workers, and mayors. Griffith won a MacArthur award.

Johnston, Nicholas, & Parzen. 2013. *The Guide to Greening Cities*. Island Press. Superb, in-depth presentation of what has worked, written by the same people who helped transform Chicago,

Vancouver, and other large cities. Two of the authors helped co-found the Urban Sustainability Directors Network. Lots of concrete examples for every aspect of sustainability, plus most chapters end with case studies. Inspiring but practical: What elements were critical for success? How were the barriers to sustainable change overcome? Delves into the details, including not just strategies and social marketing but performance management and the critical area of financing. Shows multiple pathways to a specific outcome. Good psychology throughout: Change can be hard, but emphasizing its positive side (e.g., many cost savings) makes it an easier sell. Metrics were critical. An awesome resource for everyone trying to support greener cities.

Wallace-Wells, David. 2019. *The Uninhabitable Earth: Life After Warming*. Penguin. Deservedly a bestseller: insightful and well done, but also the ultimate in terrifying. Do read this, but maybe in small doses (that's how I managed). Never use Bitcoin, by the way. A quote that hit home: "That climate change demands expertise, and faith in it, at precisely the moment when public confidence in expertise is collapsing, is one of its historical ironies" (p. 160). BUT – if we accept responsibility and move faster, it's not too late. There is some good news, just not enough.

Goodell, Jeff. 2017. *The Water Will Come*. Little, Brown. Outstanding. Well researched, beautifully written, nuanced. How are developed & developing nations coping with current sea level rise and planning for more? - or not, in some cases, as Goodell devastatingly describes. As usual, follow the money. Europe provides some success stories.

Goodell, Jeff. 2023. *The Heat Will Kill You First: Life and Death on a Scorched Planet*. Again, outstanding! Well researched and beautifully written. The sheer number of people killed in heat waves is powerfully conveyed... but because those numbers only become clear later, these killers don't have the same gut impact as climate change-driven fires and floods. Thoughtful coverage of the implications, and I also appreciated his personal narratives. A NYT bestseller, highly recommended.

Bourne, Joel. 2015. *The End of Plenty: The Race to Feed a Crowded World*. Norton. Comprehensive in scope, including the technical side of agricultural research, population demographics, and economics (for example, the role of free trade and Wall Street speculation in food shortages in developing nations). Lots of great international examples, both hopeful (SRI - system of rice intensification) and discouraging. Almost 2 billion are undernourished now, with more predicted, and global warming is already a significant problem. Malthus comes to mind, and Bourne gets him right as a humanitarian who hoped people would be adaptable enough to achieve sustainability. The jury is still out.

- Little, Amanda. 2019. *The Fate of Food: What We'll Eat in a Bigger, Hotter, Smarter World*. Worthy follow-up to *End of Plenty*. High-tech, low-tech, space-age and ancient foods, meat and meat substitutes, fruits and veggies, Little covers them all, examining food system responses to our era of climate change and drought.

Harvey, Hal. 2018. *Designing Climate Solutions: A Policy Guide for Low-Carbon Energy*. Island Press. Very thorough: Everything you could want to know about the policy-based solutions to climate change – and policy is the big lever. Look what California has accomplished, and the other nations and states that are leading the way in reducing greenhouse gas emissions. Performance standards that continually increase are one of many evidence-based recommendations. Time-tested, with lots

of the details that have made the difference between success and failure. All broken down carefully and specifically by sector. ". . . the grid could run reliably and at the same cost as in 2013 on more than 50 percent wind and solar generation, reducing greenhouse gas emissions by 80 percent from 2005 levels . . ." (p. 113). A hopeful book, but the policy changes actually need to *get made*.

- Likewise noteworthy is Hal Harvey's most recent book (with Justin Gillis), 2022's *The Big Fix: 7 Practical Steps to Save Our Planet*. Up to date and nontechnical, it's an excellent introduction to climate action, with something for everyone. Covers the main sectors. Naturally, is good on policy.

Stokes, Leah. 2020. *Short Circuiting Policy: Interest Groups and the Battle over Clean Energy and Climate Policy in the American States*. Oxford UP. Highly recommended - very detailed analyses of how the big utilities have prevented or reversed renewable energy policy in different states, plus a few more hopeful cases where climate advocates fought them off. One of the most discouraging sections shows how quickly the US has to switch over to renewables now, to meet greenhouse gas reduction goals - given the decades of foot-dragging because of utility and fossil fuel co. obstruction. It's frightening. If you only have time for one chapter, I suggest the Conclusion, which includes advice for advocates. If we lose this battle, we lose the war.

Humes, Edward. 2016. *Door to Door: Magnificent, Maddening, Mysterious World of Transportation*. Harper. Really impressive reach - freight, ocean shipping, ports, robotic cars . . . The down side of fast shipping (**avoid Amazon Prime and its ilk, please**). Covers congestion now, the carnage on the streets that we take for granted (pedestrians beware), the gross inadequacy historically of the US gas tax, all the ins and outs. An American dies in a car accident every 15 minutes . . . Life cycle analyses for transport of everyday items are eye-opening. Also the harm done by SUVs. Lots of interesting facts, and – overall - a hopeful book (NYC is a success story in some surprising ways). Moving to electric vehicles is absolutely critical, and I'm proud to say I have done so! For those interested, UC Davis professor Dan Sperling's more technical and focused *Three Revolutions: Automated, Shared, and Electric Vehicles to a Better Future* (2018) is great too. EVs aren't enough; amping up all the forms of ride-sharing is absolutely critical.

Lynas, Mark. 2020. *Our Final Warning: Six Degrees of Climate Emergency*. An update of his earlier work, *Six Degrees*. Lays out the different, tragic outcomes resulting from different levels of global warming, in every sector and part of the globe. Even 2 degrees is bad (heck, even where we are now at 1.2 degrees is!). 3 degrees is profoundly frightening, and yet unless we take swifter action, it's on the horizon. You will lose sleep, and maybe that's what's needed. Based on recent climate developments and scientific research, there are fewer positive outcomes than in his earlier book. If you need to motivate someone, this provides lots of ammunition. The title says it all. We are balanced on the precipice of catastrophe.

Rich, Nathaniel. 2019 *Losing Earth: A Recent History*. Farrar. During 1979-89 the world almost got international climate action. Covers unfamiliar history as well as brief summaries of well-known incidents like NASA's James Hansen's Congressional testimony (& events have shown that he nailed it). John Sununu emerges as one of the villains, along of course with a fossil fuel industry that almost chose an ethical route rather than its disastrously successful disinformation campaign. Outstanding,

short, reads like a novel. A dystopia, sadly. But maybe seeing where we went wrong can help us now?

General Recommended List
Bigger Picture/Economics

Cullenward, Danny, & Victor, David. 2021. *Making Climate Policy Work*. Shows that market-based carbon pricing systems haven't been doing that much, the EU excepted. It's regulations and industrial policy that have actually been reducing GHG emissions. As Jaccard noted below, the politics get in the way of economists' ideal market-based solutions. The authors go into wonky depth on the problems in different states and nations in making cap and trade or carbon taxes work, then they offer solutions. Thorough international analysis, lots of graphs and tables. Impressive and important. We *have* to do better at getting GHG emissions down, and fast.

Raworth, Kate. 2017. *Doughnut Economics: Seven Ways to Think Like a 21st Century Economist*. Which means recognizing that we need to achieve sustainability on a planetary as well as national scale – and that means modifying our economic framework and expectations. Insightful. Practical suggestions include promoting the sharing economy, deemphasizing GDP, being "agnostic" on economic growth, incentivizing regenerative approaches, and changing patent law. Good on addressing inequity. Good on the importance of framing: "tax justice" and "public investment" should be the watchwords. A few weak spots from my viewpoint as a behavioral psychologist, but overall, a valuable read.

Klein, Naomi. 2015. *This Changes Everything*. Like Raworth, makes the case for systemic modifications in the Western approach to the economics of climate change, particularly in the US. I had some issues with parts of it, but consider it a worthwhile and thought-provoking read.

Klein, Naomi. 2019. *On Fire: The (Burning) Case for a Green New Deal*.

Klein, Naomi. 2017. *No is Not Enough*.

Follow-ups to *This Changes Everything*. Updates and historical comparisons. The criticism of insufficiently-regulated US-style capitalism continues: From *On Fire*, **“There is simply no way to square a belief system that vilifies collective action and venerates total market freedom with a problem that demands collective action on an unprecedented scale and a dramatic reining in of the market forces that created and are deepening the crisis.”** (p. 70) Fun fact for some relief from bad news: During WWII, citizens' Victory Gardens provided over 40% of produce consumed in the US.

And for a counterweight to Klein,

Jaccard, Mark. 2020. *Citizen's Guide to Climate Success*. Insightful. A Canadian academic, economist Jaccard spent years in charge of British Columbia's utilities commission, and helped design its carbon tax and clean energy standard. He's seen the vicious politics and misinformation campaigns threatening these gains. Outcome: Anything perceived as a "tax" is likely to be a political loser, while flexible regulations and cap-and-trade are more acceptable. Working with sincerely concerned politicians is critical, focusing on electricity and transportation. Jaccard is sincere himself, to the

point of spending a few civil disobedience hours in jail for a coal train demonstration – impressive! But he considers Klein's approach too extreme. While his chapter on behavior change is not ideal (my view, my area), this is an impressive, well-thought-out book and an engaging read as well.

Lonergan, Eric & Sawers, Corinne. 2022. *Supercharge Me: Net Zero Faster*. Lonergan is an economist and it shows. Based in part on Jaccard's book, powerful arguments for a range of finance-system based incentives to cut greenhouse gas emissions faster. I loved the focus on EPICs, "Extreme Positive Incentives for Change." To electrify faster, make those alternatives comparatively cheaper, duh. EPIC methods have worked for places like Denmark and California. The authors list some innovative ways for global financing, taking advantage of existing institutions like "export credit agencies" (don't ask). "Smart regulations" where necessary, and "contingent carbon taxes" that focus on greening a specific industry. And more. We can still meet the climate challenge if we act *fast*. The payoff is improved lifestyles around the world, and thriving economies. An important book, global in scope. Highly wonky in some chapters, but worth the effort.

Burt, Justine. 2019. *The Great Pivot: Creating Meaningful Work to Build a Sustainable Future*. Excellent, with a very practical focus on shifting the US economy. Benefits are emphasized, but downsides, such as job losses in old-economy areas, need to be offset by green jobs and training. A nice summary and handbook, with many useful tables and graphs. Includes costs (e.g., for bike infrastructure) and means of financing. Includes current transportation sustainability apps – I can't keep up with them all! Burt has her own consulting firm and it shows.

Bittle, Jake. 2023. *The Great Displacement: Climate Change and the Next American Migration*. Outstanding. Agonizing real stories of Americans dealing with floods, fires, sea level rise, drought, etc. - and losing their homes and communities and savings. Winners and losers and the role of the insurance industry and government bureaucracy. Excellent policy analysis and recommendations, including the social justice implications.

- Bittle deals with internal migration only. Also note Gaia Vince's *Nomad Century* for the benefits of welcoming international climate migrants.

Pettifor, Ann. 2019. *The Case for the Green New Deal*. Excellent. Laser-focused on the financial side (so be prepared for occasional heavy wading; it's short and that helps). Monetary and fiscal policy – the arcane financial workings of our modern world, private vs public savings and debt, and the history with its ups and downs, heroes and villains. Lots of detail. If we don't get this right, we won't be able to make change that's fast enough and large enough. Pettifor notes how critical it is to target the industries and people with the highest carbon footprints. Includes some coverage of environmental justice for the Global South and the poor in the North.

Berners-Lee, Mike. 2019. *There Is No Planet B*. Excellent, if not quite the standout as his *How Bad Are Bananas* (below). Broad in scope, including not just food, energy, transport – the usual suspects – but discussion of the importance of a more equitable income distribution. **What we're aiming for with sustainability: a clean environment, and healthy, long lives for everyone, with restored biodiversity, less violence, more trust and collaboration in a global community that respects everyone's rights.**

Oreskes, Naomi & Erik Conway. 2012. *Merchants of Doubt*. Masterful investigative report documenting deliberate media campaigns of lies by the tobacco industry and then the fossil fuel industry – casting public doubt on established science even as internal documents show that the science was actually acknowledged by these large corporations. Often using the same legal and marketing teams. PBS's Frontline recently had a corresponding series on The Power of Big Oil with some revealing interviews with oil industry executives and scientists. Absolutely shameful.

Turner, Chris. 2012. *The Leap: How to Survive and Thrive in the Sustainable Economy*. Sustainability hopes examined in depth, good news and bad. "The mainstream of food production . . . remains committed to a system of industrial monocrops grown in artificially over-fertilized soil, kept alive by petrochemical pesticides, tended, harvested and distributed by an oil addicted processing system, and maintained by a vast web of perverse subsidies. This is a fundamentally unsustainable food production system, a sort of cheap food bubble propped up by low-cost fossil energy" (p. 276). But I emphasize the many causes for hope Turner provides, and we need that. Impressive.

Hill, Alice & Martinez-Diaz, Leonardo. 2020. *Building a Resilient Tomorrow: How to Prepare for the Coming Climate Disruption*. Excellent, focus on resilience - and solutions. Includes markets, legal approaches, novel finance & insurance mechanisms, relocation vs in-place resilience, climate refugees & immigration, data accessibility, inequality, national security, and health implications. Practical examples from policy wonks who know how to make change happen.

Karelas, Andreas. 2020. *Climate Courage*. Good take on our current status (pre-covid). Thoughtful, realistic but hopeful coverage. Buys into some pop psychology, but I liked its coverage of the fossil fuel subsidies, road maps to clean energy (her own expertise is in solar), inspiring solar successes, the importance of a more plant-based diet, and a useful list of what people need to do – including what they need to *change*.

Klinenberg, Eric. 2002/2015. *Heat Wave: A Social Autopsy of Disaster in Chicago* (2nd ed). U Chicago. Magnificent. A sociologist's comprehensive critique of the conditions leading to the 1995 Chicago heat wave tragedy in which hundreds died, often alone. Thorough and detailed, exploring government, politics, media, community, SES, race, gender, economics. Very readable too. We have learned how to do better, which is fortunate, because dangerous heat waves are becoming routine.

Nuccitelli, Dana. 2015. *Climatology versus Pseudoscience: Exposing the Failed Predictions of Global Warming Skeptics*. Praeger. Excellent summary of climate change models and how their predictions have held up. Data-based refutations of the contrarians, as the author calls deniers. Also excellent on "false balance" in the media - giving disproportionate attention to contrarians long after their claims had been scientifically refuted. Behind-the-scenes included, as Nuccitelli himself was a leading author on one of the high-impact papers reexamining the extent of the consensus among climate scientists, and confirming the earlier 97% figure. I am honored to know Dana, who blogs for Yale Climate Connections – my favorite e-newsletter – and is now a Research Coordinator with Citizens' Climate Lobby.

Kalmus, Peter. 2017. *Being the Change: Live Well and Spark a Climate Revolution*. A climate scientist from CalTech and NASA with a wife and two children cut his family's carbon footprint drastically in innovative ways, and is loving the change. Some of the recommendations are not for everyone – raising chickens? – but they're inspiring.

Berners-Lee, Mike. 2011. *How Bad are Bananas: The Carbon Footprint of Everything*. Euro-centric and now somewhat outdated (and I question a few of his assessments). But this great book does something really important: look at the greenhouse gas impact of all sorts of human activities, while recognizing the complexities in trying to generate even ballpark figures. His order of magnitude categorization is useful, as is his understanding of the nuances. A book full of humor despite the content. Berners-Lee focuses on behavior changes that have a significant impact; let's not dwell on the small stuff too much. For example, boat transport for produce/goods is cheap & CO2 friendly. So local doesn't always win (even if it's still usually a good idea), and bananas are fine (in case you were wondering!).

MacKinnon, J. B. 2023. *The Day the World Stops Shopping*. Excellent! Looks at many different angles of consumerism. Yes, the climate crisis means we in the developed world need to cut way back on buying stuff, but how do we do that without wrecking the economy? The answer is, carefully and thoughtfully - and with an eye out for the workers in developing nations who will need extra help with the transition to sustainability. Well written, interesting examples.

Helm, Dieter. 2017. *Burn-Out: The Endgame for Fossil Fuels*. Yale U. Excellent. Good graphs; the global economics of energy in the next 50 years; historically informed. Electricity as the future, with a smart systems basis. Natural gas as the transition fossil fuel. This is controversial; I wonder if he's changed his position at this point, in 2023. But, Ukraine...

Royte, Elizabeth. 2011. *Bottlemania: Big Business, Local Springs, and the Battle over America's Drinking Water*. You'll never buy bottled water again! An important book. Well documented, yet an engaging read, albeit a frustrating one. As usual, follow the money. A bit dated now, but the message is still important. <sigh> All that bottled water in the groceries, yikes.

Briefly

Boswell, Greve, & Seale. 2019. *Climate Action Planning: A Guide to Creating Low-Carbon, Resilient Communities*. I wish I'd known about this workbook as soon as it came out - we could have used it in my climate action coalition. It lays out all the local climate action steps in detail, with lots of real-life examples from small to large cities across the US. That includes greenhouse gas inventories and climate action plans, community engagement, financing, and implementation. I loved it.

Rush, Elizabeth. 2018. *Rising: Despatches from the New American Shore*. What to do when your house is in a flood zone during this era of rising sea levels? What happens to your neighborhood? And how does socioeconomic status influence the outcomes? (Hint: quite a bit.) Rush focuses on the poor and middle class, in a poetic elegy on environmental injustice and (sometimes) resilience. But the human stories resonate most powerfully. Includes the challenges of getting these interviews.

Thunberg, Greta. 2019. *No One Is Too Small to Make a Difference*. A short collection of her inspiring talks. Excellent, motivational.

Nesbit, Jeff. 2018. *This is the Way the World Ends: How Droughts, and Die-Offs, Heat Waves and Hurricanes Are Converging on America*. Overall - good. Covers a lot of scary ground, includes interviews.

Otto, Friederike. 2019. *Angry Weather: Heat Waves, Floods, Storms, & the New Science of Climate Change*. All about climate change attribution science, from an Oxford scientist who co-led its development. She and a few colleagues have been doing this work for free. Very clear. Quote: **"People who profit from a system often don't want to change it; rich states and fossil fuel-exporting countries benefit from fossil fuels. They say the right things and then prevent necessary measures from being taken. This is one of the main problems with climate negotiations."**

Blue, Elly. 2013. *Bikenomics: How Bicycling Can Save the Economy*. A real eye-opener. Adding bicycling infrastructure bring all sorts of *economic* benefits along with better health and (obviously) climate action benefits. Well-researched, inspiring, good examples.

Sherrell, Daniel. 2021. *Warmth: Coming of Age at the End of Our World*. Young climate activist Sherrell writes to his future child, should he choose to have one, about the overwhelmingness of what he calls The Problem that his generation was born into. How do we cope? Excellent psychology. Riveting, powerful, cathartic, for me, anyway. And beautifully written.

Owen, David. 2017. *Where the Water Goes*. Colorado River system under threat. Excellent, timely.

Gardiner, Beth. 2019. *Choked: Life and Breath in the Age of Air Pollution* – causing about 7 million early deaths/year worldwide. Great coverage of Dieselgate, which involved many cheating manufacturers, not just VW. India's smog is unimaginable – significantly worse than China. Cutting back on fossil fuels will have many benefits. Recommended.

Romer, Jennie. 2021. *Can I Recycle This? A Guide to Better Recycling (And How to Reduce Single-Use Plastics)*. Valuable info about what can be recycled, what can't, and why. A theme throughout is the need to reduce single-use plastics, and how to go about that.

Milman, Oliver. 2022. *The Insect Crisis*. Magnificent and depressing. Thoroughly covers the research showing serious declines for many insects, and how devastating that would be. They run the planet... pollination is just one prime example. Well written too. Good summary of the solutions: change ag, less pesticide use, more cover cropping, more hedgerows and "weeds," etc.

Neonicotinoids are hugely problematic and often minimally helpful to farmers.

-Goulson, Dave. 2022. *Silent Earth: Averting the Insect Apocalypse*. Covers the same ground and is also outstanding – also highly recommended. More focused on the UK than Milman's book.

Stoknes, Per. 2015. *What We Think About When We Try Not to Think about Global Warming: Toward a New Psychology of Climate Action*. Mixed, from my point of view as a behavioral psychologist . . . but good in many ways.

Minter, Adam. 2015. *Junkyard Planet: Travels in the Billion-Dollar Trash Trade*. The recycling side of sustainability. Well done, and global indeed in scope.

Minter, Adam. 2019. *Secondhand*. Again, really impressive - global reuse markets rather than recycling. Fascinating, with many unexpected twists as Minter digs deep into where used stuff goes. Goodwill is just the beginning, and how. More important for sustainability than recycling, with "reduce" being the prime directive, of course!

Funk, McKenzie. 2014. *Windfall: The Booming Business of Global Warming*. Is this good or bad? It depends . . . Fascinating examples. Recommended.

Robinson, Kim Stanley. 2020. *The Ministry for the Future*. The famed science fiction author produces a hybrid – a novel that reads like nonfiction in many places, with lots of solid facts. This is very near-term climate fiction, featuring realistic setbacks, on a global scale. If the potential solutions involve excessive geo-engineering, well, we may come to that if safer climate rescues never gain enough political traction. Lots on the critical economics, yet the human drama works too.

Powell, James. 2020. *The 2084 Report*. Another fictional work that includes lots of climate facts, and it's absolutely riveting. An all-too-real oral history of earth's gradual descent into dystopia, with first-person accounts of floods, fires, droughts, water wars, and climate refugees with nowhere to go. The author comes out awfully strong for nuclear at the end, and not enough for renewables, I think, but that's a minor quibble.

Kramer, Ron. 2020. *Carbon Criminals, Climate Crimes*. Provides the criminology context for corporations' and governments' misinformation campaigns and failure to act. Thoroughly documented.

McKibben, Bill. 2014. *Oil & Honey*. Also 2011 *Eaarth: Making a Life on a Tough New Planet*. The old campaigner, founder of 350.org. Both are worthwhile.

Gore, Al. 2017. *An Inconvenient Sequel*. Excellent – an easy read with lots of graphics, yet covers the basics and inspires with great examples.

Bell, Alice. 2021. *Our Biggest Experiment: An Epic History of the Climate Crisis*. Wide-ranging and thoughtful. Includes contributions of women and minorities.

Fothergill, Scholey, & Pearce 2019. *Our Planet*. The accompaniment to Netflix's series, narrated by David Attenborough. More than just a beautiful coffee table book with many illustrations from the series. Lots of substance here in the form of global information, data summaries, and useful figures (e.g., the world's current and potential forests, the world's dead zones). Very readable.

Attenborough, David. 2020. *A Life on Our Planet: My Witness Statement and a Vision for the Future*. Likewise, covers a lot of environmental ground while featuring highlights of a remarkable life. A plea for change that includes success stories. Likes Kate Raworth's approach to economics (see above).

Figueres, C & Rivett-Carnac, T 2020. *The Future We Choose: Surviving the Climate Crisis*. The authors were in charge of the 2015 Paris climate agreement process. A short summary of where we are, strongest on visualizing what the future could look like if we do take action.

Doerr, John. 2022. *Speed & Scale: An Action Plan for Solving Our Climate Crisis*. From a venture capitalist who funded Google and other big tech startups, including the solar giant Enphase. (My solar panels use Enphase.) Quantifies what a climate action plan must aim for with different sectors, with a focus on venture capitalist funding. Features behind-the-scenes stories from other cleantech leaders.

Margolin, Jamie. 2020. *Youth to Power*. A young activist tells it like it is for young activists - impressive. What to do to fight the climate crisis, and how to overcome the barriers. Much of it is applicable to any activist. Inspiring and practical. Blurbs from Al Gore, McKibben, Ken Burns - wow.

Freinkel, Susan. 2011. *Plastic: A Toxic Love Story*. Thorough, thoughtful, and beautifully written. From the early history, the good, the bad, and the ugly. "Extended Producer Responsibility" is critical to "green" this commodity in all its many forms. Interesting fact: Sometimes petroleum-based plastic is biodegradable and plant-based forms aren't. A bit dated, but it stays for a while longer.
